EXAMINER'S AMENDMENT

 An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Jim Leary on 12/14/2010.

The application has been amended as follows:

- Claim 1: An interface device for use with an ultrasound imaging system having a scan head with at least one transducer, the interface device being removably attachable to the scan head, the interface device comprising:
 - a reservoir with a proximal end and a distal end, said proximal end being open and shaped to allow the transducer to be inserted within said reservoir, wherein said proximal end of said reservoir is configured to maintain a fluid tight seal between said reservoir and the scan head, and wherein said distal end of said reservoir is configured to extend past a distal end of the transducer.
 - a scan window located proximate said distal end of said reservoir through which ultrasound energy is transmitted and received, wherein said scan window is formed of a solid, non-flowable hydrogel,

Application/Control Number: 10/521,045

Art Unit: 3768

a fluid tight seal between said scan window and said distal end of said reservoir,

and a fluid acoustic coupling medium located within said reservoir and filling a space between said transducer and said scan window,

and means for adjusting a distance between said scan window and the transducer to allow adjustment of a position of said scan window with respect to a focus of the transducer.

wherein said solid, non-flowable hydrogel comprises a cross-linked hydrogel

and wherein said scan window further comprises a support structure

comprising a mesh of filaments embedded in the cross-linked hydrogel.

Claim 5: The interface device of Claim 1, wherein said selid, non-flowable hydrogel comprises a cross-linked hydrogel and wherein said sean window further comprises a support structure comprising a mesh of filaments embedded in the cross-linked hydrogel- reservoir has an adjustable length for adjusting a distance between the scan window and the transducer.

Claim 10: The interface device of Claim [[1]]5, wherein the distance between said scan window and the transducer is adjustable to position the transducer focus approximately 2 to 6 mm distal to said scan window.

Art Unit: 3768

Claim 21: The interface device of Claim 1, wherein the sean window emprises a cross-linked hydrogel and a support structure comprising a said mesh of filaments is in a crossing pattern embedded in the cross-linked hydrogel.

Claim 22: An interface device for use with an ultrasound imaging system having a scan head with at least one transducer, the interface device being removably attachable to the scan head, the interface device comprising:

- a reservoir with a proximal end and a distal end, said proximal end being open and shaped to allow the transducer to be inserted within said reservoir, wherein said proximal end of said reservoir is configured to maintain a fluid tight seal between said reservoir and the scan head, and wherein said distal end of said reservoir is configured to extend past a distal end of the transducer.
- a scan window located proximate said distal end of said reservoir through
 which ultrasound energy is transmitted and received, wherein said scan
 window is formed of a solid, non-flowable hydrogel,
- a fluid tight seal between said scan window and said distal end of said reservoir.
- and a fluid acoustic coupling medium located within said reservoir and filling a space between said transducer and said scan window,
- wherein the reservoir has an adjustable length for adjusting a distance between the scan window and the transducer[[.i]],

Art Unit: 3768

and wherein said solid, non-flowable hydrogel comprises a cross-linked

hydrogel and wherein said scan window further comprises a support

structure comprising a mesh of filaments embedded in the cross-linked
hydrogel.

Claim 23, lines 16-18: Delete lines, starting with "and means for adjusting" through "focus of the transducer".

Lines 13-14: add --and-- between "said reservoir," and "a fluid acoustic".

Claim 25, Line 2: Replace "said distance" with --a distance--.

Reasons for Allowance

2. The following is an examiner's statement of reasons for allowance:
Previously in the Office Action mailed 03/18/2010, Claim 9-10 & 22 were
indicated as allowable as such a modification to the invention of Crowley would
destroy the Crowley reference. The Applicant amended the Claims by putting
the subject matter of Claims 9-10 & 22 into the independent claims. However
upon further consideration such an amendment proved problematic in that
"means for adjusting" was not properly supported by the Applicant's originally
filled disclosure. Further consideration revealed that the structure of Crowley with
regard to the foraminous composite sheet was NOT analogous in form and
function to the Applicant's claimed "mesh of filaments". For instance the
structural nature of the filaments of the Applicant would have lesser ultrasound

Art Unit: 3768

attenuation than the foraminous composite sheet of Crowley. The prior art fails to disclosure ultrasound interface devices with a scan window comprising non-flowable hydrogel with embedded filaments for structural support.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
